The abstract of the disclosure is objected to because it is not directed to the claimed subject matter. It refers to a lamp cover, not a UV absorbing film. Correction is required. See MPEP § 608.01(b).

The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

The European Search report was considered, but it has a line drawn through it since search reports are not art.

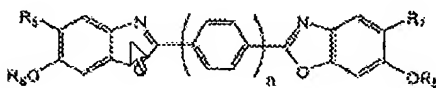

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent Application Publication 2003/0170467 (Cornelius et al) in view of U.S. Patent 3,798,231 (Fleck et al).

Cornelius et al teaches an ultraviolet filter film comprising a transparent support layer, an adhesive layer and a UV blocking layer which comprises an ultraviolet absorber and fluorescent optical brightener which absorbs light in the region of 340-400 nm and emits light in the range of 400-500 nm. Paragraph 0105 teaches oxazole type optical brighteners are preferred. Cornelius et al does not teach the claimed optical brightener. Fleck et al teach an oxazole type optical

brightener having the formula , where n is 4, R<sub>6</sub> and R<sub>8</sub> are alkyl with 1-4 carbon atoms and R<sub>5</sub> and R<sub>7</sub> can be an alkyl with 1-4 carbon atoms. This

Art Unit: 1755

brightener absorbs light in the region of 340-400 nm and emits light in the red-violet range, which is within the 400-500 nm range. Accordingly, one of ordinary skill in the art would have found it obvious to use the brightener of Fleck et al as the fluorescent optical brightener since the one in Fleck et al has the properties required by Cornelius et al. While the references do not teach a mold releasing paper, the coating in Cornelius et al is applied to articles using the adhesive layer. It is notoriously well known in the art to place a mold releasing paper over an adhesive layer of a film to protect the adhesive layer until one of ordinary skill is ready to apply the film to an article. The references suggest the claimed film.

Applicant cannot rely upon the foreign priority papers to overcome this rejection because a translation of said papers has not been made of record in accordance with 37 CFR 1.55. See MPEP § 201.15.

Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Fleck et al.

As stated above, this reference teaches an optical brightener having the formula

, where n is 4, R<sub>6</sub> and R<sub>8</sub> are alkyl with 1-4 carbon atoms and

R<sub>5</sub> and R<sub>7</sub> can be an alkyl with 1-4 carbon atoms. Column 11, lines 40-43 teach films comprising this brightener, which absorbs ultraviolet light. Thus the reference teaches an ultraviolet absorbing film and suggests the claimed film.

Claim 4 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Art Unit: 1755

There is no teaching or suggestion in the cited art of record of a film comprising an optical brightener having the claimed formula.
